

Q. Discuss the components of the mobile application and workflow of its application development?

Components of mobile App:-

Answer is on Previous Pages.

Workflow for MAD:-

⇒ The workflow for developing a mobile application involves several stages and steps, often following an iterative and agile approach.

(1) Conceptualization and Planning:

- Define the app's purpose, target audience, and core features.
- Create a project plan, including timelines, budgets and resources.
- Conduct market research and

competitor analysis.

(2)

Design and Prototyping:

- Create wireframes and mockups to visualize the app's user interface.

- Design the app UI/UX, including layouts, navigation and branding.
- Develop interactive prototypes for user testing.

3) Development:-

- Write code for the app's front end and backend components.
- Implement features and functionality based on design and requirements.
- Integrate third-party services, libraries and APIs.

4) Testing

- Conduct various types of testing, including functional, usability, performance, and security testing.
- Identify and fix bugs and issues.
- Test on different devices and platforms.

5) Deployment

- Prepare the app for deployment by creating signed and optimized builds.

- Publish the app to app stores (e.g., Google Play store, Apple App Store).
- Follow platform-specific guidelines and requirements.

~~(6) Deployment:~~

(6) User Feedback and Iteration:

- Collect user feedback and reviews.

(7) Maintenance and Updates:

- Monitor and maintain the app to ensure it continues to function correctly.

(8) Marketing and Promotion:

- Develop a marketing strategy to promote the app.
-
