

Ch#7

Q. (Long) Describe the four primary stages in multimedia project?

Definition:-

⇒ A multimedia project is a creative endeavor that combines different forms of media such as text, images, audio, video, and interactive elements.

⇒ It aims to convey a message or tell a story by integrating these elements into a cohesive and engaging experience for the audience.

Examples:-

- Educational presentations
- Interactive websites
- Video games

Stages:-

⇒ The basic stages of multimedia project are:

- Planning & costing
 - Design and production
 - Testing & delivery
- ⇒ Knowledge of hardware and software, as well as creativity and organizational skills are essential for creating a high quality project.

(1) Project Conceptualization:-

⇒ Every project begins with a concept. A multimedia project concept is actually the definition of the project.

⇒ To define the project, it is required for the development team and the clients to do the various meetings and discussions to identify the actual problem.

⇒ It may be the upgradation of the existing one or the entirely new one.

⇒ It must satisfy the existing requirements of the customers.

(2) Planning and Costing:-

⇒ The planning stage is the foundation of any multimedia project.

⇒ In this stage the analysis of the idea is done which is to be translated into a multimedia project.

⇒ It involves defining the project goals, target audience, scope, and objectives.

⇒ The idea can be further refined by outlining its objectives and messages.

=> Before starting to develop multimedia project, it is necessary to plan what writing skills, graphic art, music, video and other multimedia skills will be required.

=> It is also necessary to estimate the time needed to prepare all elements of multimedia and prepare budget accordingly.

=> After preparing a budget the prototype of the concept can be developed.

=> Proof-of-concept or prototyping is simple a working example to demonstrate whether an idea is feasible.

(3) Design and production:

=> Once the project is taken up for development, the laborious project development cycle starts.

=> Each of the planned tasks refer to create a finished project.

=> During this stage, there may be many feedback cycles with a client until the client is happy.

=> Under this stage, the various sub-stages are to be carried out:

- Data Galleries
- Navigation menu structure
- Media content design
- Storyboarding
- Integration (multi-media authoring)
- Interface designing

Testing:

=> In every project, the testing stage ensures that the product to be free from bugs.

=> Apart from elimination of bugs, also need to test if it meet the objectives of project.

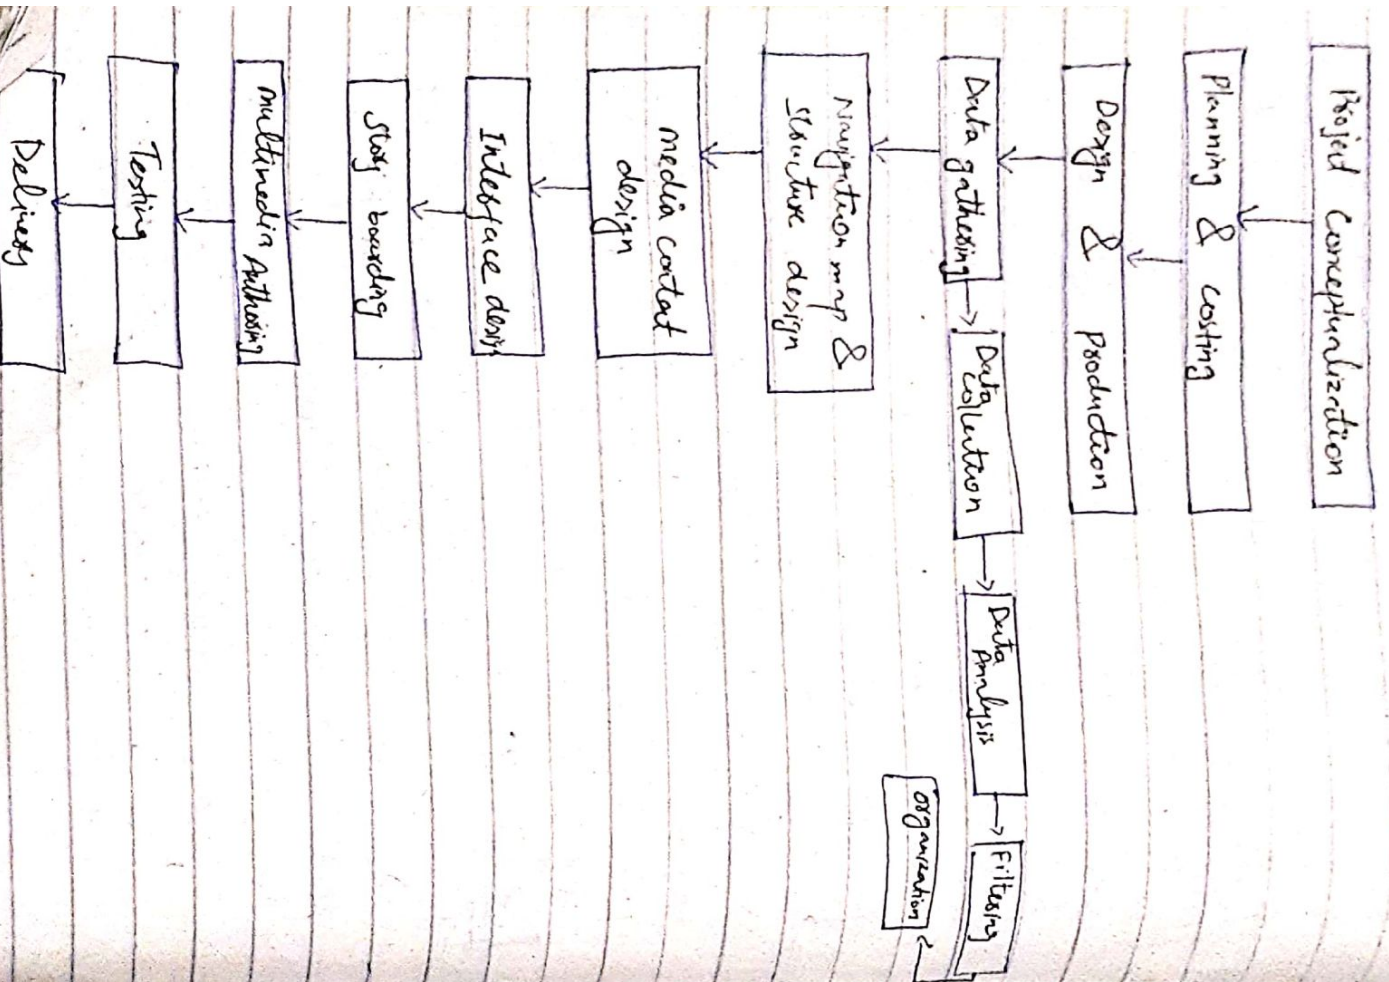

=> It is also necessary to test whether the multimedia project works properly on the planned delivery platforms and meet the needs of the clients.

Delivery:

=> The final stage is to pack the project and deliver the complete project to the end-users.

- => The stage has several steps such as:
- Implementation
 - Maintenance
 - Shipping & Marketing
 - Support / Repairs
 - Upgrade

Diagram:

Q1o make good multimedia what we need?

- Hardware
- Software
- Good ideas
- Talent
- Skill
- Good organization of work

Q# What are the intangible elements needed to make good multimedia?

- Creativity
- Organization
- Communication skills

Q# List two painting software.

- Photoshop
- Fireworks
- Painter

List two design software.

- Corel Draw
- Freehand
- Illustrator
- Canvas

Name two significant platform for producing & delivering multimedia?

- Apple macintosh OS
- Microsoft windows OS

Write the kind of input devices in multimedia environment?

- o Optical character recognition (OCR)
- o UPC
- o barcode
- o Voice recognition systems

Q-What are time based authoring tools?

⇒ Time based authoring tools are authoring systems, wherein elements and events are organized along a timeline, with resolutions as high as or higher than 1/30 second.

e.g.

- o Flash
- o Director
- o Hype
- o Unity3D

Q-What is clipping?

— The clipping is a type of transformation used in computer graphics to remove lines, objects and segments of lines that are outside the computer screen or viewing pane. The clipping is a problem of dividing the visible and invisible part of the image, object or any line segment.

— it can be used in 2D and 3D graphics.
