

To

Cyber ethics

Q. What is cyber ethics?

→ Study of:

- Social
- legal
- moral

issues involving cyber technology.

→ Study of right and wrong behavior when using technology like computers and the internet.

→ The goal of cyber ethics is to guide how we use technology responsibly, while keeping everyone safe.

Q. What is Cyber technology?

Cyber technology includes all types of devices that use computers and the internet.

→ Could be anything from a smartphone or a laptop to a bigger system like mainframe computers.

→ Computing & Communication devices

→ Some devices are connected directly to the internet, while others are part of private networks.

→ Private networks could be LAN, WAN and MAN, that connects devices.
→ Cyber technology helps us communicate, work and store information across these connected systems.

Why the term cyber ethics?

→ The term cyber ethics is used because it covers a broader range of issues than "computer ethics" or "internet ethics".

Computer ethics:

only about the machines or the people who work with computers.

Internet ethics:

just about the internet & its network.

→ But cyber ethics includes all the technology like smartphones, computers and the internet.

→ it involves the ethical issues involving any type of technology.

Phases of Cyberethics

1- Foundation phase: (Pre-internet era)

focus on:

• Privacy, property and intellectual ownership.

• Ethical considerations rooted in early computing and information systems

Key issues:

- Data privacy
- Software privacy
- Computer crime
- Intellectual property

2- Initial internet Phase (early internet era)

focus on:

As internet emerged in 1990s, new ethical challenges arise related to:

- Communication
- information sharing
- global interaction

Key issues:

- internet access
- free speech
- online privacy
- digital content sharing (like file-sharing & copyright)

3. Cybersecurity & online regulation

Phase:

focus on:

- Cybersecurity
- protecting data
- regulating online activities by both government and companies.

key issues:

- Protecting data and information security

- Preventing hacking & cyberattack
- Fighting cybercrime
- surveillance - tracking people online activities like what websites they visit, their emails, phone calls or social media usage.

4. AI, automation & emerging Technologies phase:

focus on:

- Growth of AI, automation and ML brings new ethical questions about how humans and machines interact,
- fairness in AI decisions

key issues:

- Using AI in ethical and responsible way
- Algorithmic bias (unfair decisions made by AI)
- Responsibility of AI behavior
- Deepfakes (fake images or videos created by AI)
- New types of cybercrime such as ransomware and cyberstalking.

Uniqueness Issue

→ Uniqueness issue ask whether technology has introduced new, unique crimes and ethical concerns.

Two points of view:

1. Traditionalist's view:

Argument:

Crime is still crime, regardless of the technology used. for example,

Reasoning:

They believe that computers have not really created new ethical problems, just change how we deal them.

2. Uniqueness proponent's view:

Argument:

Cyber technology has created new ethical problems that could not have existed before computers.

Reasoning:

They argue that some of the ways cyber technology works are completely new require unique ethical considerations.

Criticism of Both sides

Traditionlists are partly wrong:-

→ They ones look

- how the scale (how many people can be affected)

- And scope (how far reaching the effects are)

for example:

Cybertalkers can affect the people of all around the world, not just locally.

Uniqueness proponents are partly wrong:-

- Overemphasize how much technology changes ethics.

- Just because technology is different does not mean the ethical issue is completely new.

Logical fallacy: They argue that because cyber technology is unique, the ethical issue must also be unique, which is not always true.

Conclusions:

→ Both sides have valid points:

Traditionlists:

are right that no completely new ethical issues have emerged because of computers.

Uniqueness proponents:

are correct that cyber technology has made existing ethical issues more complicated and harder to analyze.

What is Netiquette?

⇒ Set of rules and guidelines for polite and respectful behavior while communicating online.

⇒ It is a mix of "network" (for online communication) and "etiquette" (meaning polite behavior).

Importance:

- Promote positive interactions
- Avoid arguments and confusion
- Improves online interactions

Rules of Netiquette:

1. Be Respectful:

Always be kind and polite to others, and avoid using offensive words.

2. Think before You post:

Take a moment to think about what you are about to say or share. Don't post something that could hurt others.

3. Use clear language:

Avoid using confusing language or jargon. Make sure message is easy to understand.

4. Respect privacy:

Never share someone else's personal information without asking them first.

5. Stay on topic:

Keep discussions relevant to the subject being discussed so the conversation stays focused.

6. Don't plagiarize:

7. Thank people who help You:

8. Don't overuse emojis:

9. Don't express offensive opinions:

10. Don't type in all capital letters:

11. Don't send unwanted spam msg:

12. Check msg and respond promptly:

13. Don't post private or embarrassing images:
