

Q. Elaborate Toolbox?

Android widget

⇒ Android supplies a toolbox of standard Views that help to create simple interface.

⇒ By using these controls, the development can be simplified and provide consistency b/w applications.

The following are some of familiar toolbox controls:

TextView:

- it is a standard read only text label. it supports multiline display, string formatting and automatic word wrapping.

EditText:

- An editable text entry box.
- it accepts multiline display, ~~at~~ & word wrapping.

ListView

- A View Group that creates and manages a group of Views used to display the items in a List.

- The standard ListView displays the string value of an array of objects using a Text View for each item.

Button

- it is a standard push button.

CheckBox

- Two state button represented with a checked or unchecked box.

RadioButton

- Two state grouped buttons. One can be selected at a time.

Spinner

it is a composite control that displays a TextView and an associated ListView that lets to create select an item from a list to display in the text box. it is made from a TextView displaying the current selection,

combined with a button, that displays a selection dialog when pressed.

⇒ Also supports ^{gallery etc.} date-time pickers, map.

Q. How to obtain the position of a view?

⇒ The geometry of a view is that of a rectangle.

⇒ A view has a location expressed as a pair of left and top coordinates, and two dimensions, expressed as a width and a height. The unit for location and dimensions is the pixel.

⇒ To determine the location of a view by invoking:

- `getLeft()`
- `getTop()`
- `getRight()`
- `getBottom()`
