

Topic #:-

Non-Comparison Sorting algorithm:

=> Algorithms that perform sorting without comparing the elements rather by making certain assumptions about the data.

They are called non-comparison sorting.

Examples:

- 1) Counting Sort (indexes using key values)
- 2) Radix Sort (examines individual bits of k)
- 3) Bucket Sort (examines bits of keys)

=> These are linear sorting algorithms.

Linear sorts are not "comparison sorts".

=> These algorithms do not need to go through the comparison decision tree.

=> Consequently, the $\Omega(n \log n)$ lower bound does not apply to them.

Limitations of Comparison sorting:

=> These are fundamental limits on the performance of comparison sorts.

$\Rightarrow$ To sort n elements, comparison sort must make $\Omega(n \lg n)$ comparisons in the worst case.

That is a comparison sort must have a lower bound of $\Omega(n \lg n)$ comparison operations, which is known as linear or linearithmic time.

Q# Write the name of asymptotically optimal comparison sort?

Heapsort
mergesort

Q#: What is the smallest possible depth of a leaf in a decision tree for a comparison sort?

$n-1$

$\Rightarrow$ because to find the minimum (or maximum) of n elements requires $n-1$ comparisons.

$\Rightarrow$ Hence, the smallest possible depth is $n-1$.

Counting Sort

Counting sort, sorts the elements of an array by counting the number of occurrences of each unique element in the array.

Counting sort assumes that each of the n input elements is an integer in the range 0 to k .

n is the number of elements
 k is the highest value element.

Counting sort determines for each input element x , the number of elements less than x .

And it uses this information to place element x directly into its position in the output array.

The algorithm uses three arrays:

Input Array: $A[1 \dots n]$

Output array: $B[1 \dots n]$

Temporary Array: $C[1 \dots k]$

Stable: Yes

In-place: No, out-of-place

Time Complexity:

$$\Rightarrow O(n+k)$$

Note: Suitable only for small range of values.

Algorithm:

- 1- Counting-Sort (A, B, k)
- 2- Let $C[0 \dots k]$ be a new array
- 3- for $i=0$ to k — $\oplus(k)$
 $C[i] = 0$ — k
- 4- for $j=1$ to $A \cdot \text{length}$ or n — $\oplus(n)$
 $C[A[j]] = C[A[j]] + 1$ — n
- 5- for $j=n$ or $A \cdot \text{length}$ down to 1 — $\oplus(n)$
 $B[C[A[j]]] = A[j]$ — n
 $C[A[j]] = C[A[j]] - 1$
- 6- for $i=1$ to k — $\oplus(k)$
 $C[i] = C[i] + C[i-1]$ — k

Example:

	1	2	3	4	5	6	7	8
A:	2	5	3	0	2	3	0	3
	0	1	2	3	4	5		
C:								
	1	2	3	4	5	6	7	8
B:								

Executing Loop 1:

	0	1	2	3	4	5	6	7	8
A:	2	5	3	0	2	3	0	3	

	0	1	2	3	4	5			
C:	0	0	0	0	0	0			

	1	2	3	4	5	6	7	8
B:								

Executing Loop 2:

	0	1	2	3	4	5	6	7	8
A:	2	5	3	0	2	3	0	3	

	0	1	2	3	4	5			
C:	0	0	1	0	0	0			

	1	2	3	4	5	6	7	8
B:								

	0	1	2	3	4	5	6	7	8
A:	2	5	3	0	2	3	0	3	

	0	1	2	3	4	5			
C:	0	0	1	0	0	1			

	0	1	2	3	4	5	6	7	8
A:	2	5	3	0	2	3	0	3	

	0	1	2	3	4	5			
C:	0	0	1	1	0	1			

	1	2	3	4	5	6	7	8
B:								

A:

	1	2	3	4	5	6	7	8
	2	5	3	0	2	3	0	3

C:

	0	1	2	3	4	5
	1	0	1	1	0	1

B:

	1	2	3	4	5	6	7	8

A:

	1	2	3	4	5	6	7	8
	2	5	3	0	2	3	0	3

C:

	0	1	2	3	4	5
	1	0	2	1	0	1

B:

	1	2	3	4	5	6	7	8

A:

	1	2	3	4	5	6	7	8
	2	5	3	0	2	3	0	3

C:

	0	1	2	3	4	5
	1	0	2	2	0	1

B:

	1	2	3	4	5	6	7	8

A:

	1	2	3	4	5	6	7	8
	2	5	3	0	2	3	0	3

C:

	0	1	2	3	4	5
	2	0	2	2	0	1

B:

	1	2	3	4	5	6	7	8

1	2	3	4	5	6	7	8
2	5	3	0	2	5	0	3
0	1	2	3	4	5		
2	0	2	3	0	1		
1	2	3	4	5	6	7	8

Exercising loop - 3:

0	1	2	3	4	5
2	2	2	3	0	1
0	1	2	3	4	5
2	2	4	3	0	1
0	1	2	3	4	5
2	2	4	7	0	1
0	1	2	3	4	5
2	2	4	7	7	1
0	1	2	3	4	5
2	2	4	7	7	8

Exercising loop 4:

Final result will be:

1	2	3	4	5	6	7	8
0	0	2	2	3	3	3	5

→ sorted array

Pros:

★ Fast

★ Asymptotically fast - $O(n+k)$

★ Simple to code

Cons:

★ Does not sort in

★ Requires $O(n)$

extra storage

Radix Sort

- ⇒ Radix Sort is non-comparative sorting algorithm.
- ⇒ Two classifications of radix sorts are least significant radix sorts and most significant radix sorts.
- ⇒ LSB radix sorts process the integer representations starting from the least significant and move towards the most significant digits.
- ⇒ Assumption
 - Input taken from large set of numbers
- ⇒ Requires only d passes through the list.
- ⇒ The input data must be between a range of elements.

Stable: Yes

in-place: No

Time complexity: $O(d(n+k))$

Note: How many times counting sort will be apply?

⇒ no of digits time.

Algorithm:-

Radixsort(A, d)

for $i = 1$ to d — $w(d)$

use a stable sort to sort array
A on digit i — $(n+k)$

Routine: / function:

Radix-sort(A, n)

{

int max = getmax(A, n)

for (pos = 1; max/pos > 0; pos * 10)

{

countsort(A, n, pos)

}

}

Countsort(A, int n, int pos)

{

int count[10] = {0};

for (i = 0; i < n; i++)

++count[(a[i] / pos) % 10];

for (i = 1; i <= 10; i++)

count[i] = count[i] + count[i-1];

for (i = n-1; i >= 0; i--)

B[Count[(a[i]/10)%10]] = a[i]

-- Count[(a[i]/10)%10]

for (i = 1; i <= 10; i++)
A[i] = B[i]

Example:

189	986	205	421	097	192	535
-----	-----	-----	-----	-----	-----	-----

Input	1st Pass	Pass 2	Pass 3
189	421	205	097
986	192	421	189
205	205	535	192
421	535	189	205
097	986	986	421
192	097	097	535
535	189	192	986

Bucket Sort:

$\Rightarrow$ it is used when input is uniformly distributed over a range $[0, 1]$

$\Rightarrow$ Works on floating point numbers between range $(0.0 \text{ to } 1.0)$

In-place:

Not

Stable: Yes or Not be

Time Complexity:

$\Rightarrow O(1) \times n$

$\in O(n)$

Note:

(Use scatter gather approach)

Algorithm:

BucketSort(A)

Let $B[0 \dots n-1]$ be a new array

$n = A.length$

for $i = 0$ to $n-1$ — n

make $B[i]$ an empty list —

for $i = 1$ to n — n

insert $A[i]$ into list $B[\lfloor nA[i] \rfloor]$ — n

for $i = 0$ to $n-1$ —

sort list $B[i]$ with insertion

Concatenate the lists together
 $B[0], B[1], \dots, B[n-1]$ (in order) —

Example:

		B	
A	0		
1	.78	1	→ .12 → .17 /
2	.17	2	→ .21 → .23 → .26 /
3	.39	3	→ .39 /
4	.26	4	/
5	.72	5	/
6	.94	6	→ .68 /
7	.21	7	→ .72 → .78 /
8	.12	8	/
9	.23	9	→ .94 /
10	.68	10	

1	2	3	4	5	6	7	8	9	10
.12	.17	.21	.23	.26	.39	.68	.72	.78	.94
